

# GuardStation

Comprising two (individual) software modules, GuardStation Remote and Maps – allowing complete management of the Guardall range of control panels, from on-site programming to full remote upload/download and monitoring. Windows based, it is designed to run on your own PC in applications ranging from security office control of sites, to full remote interrogation and service of systems. GuardStation Remote provides a solution to all your remote requirements.

| User Record Management           | ✓   |          |
| Control Panel Dial Back          | ✓   |          |
| SmartDial Super Support          | ✓   |          |
| Software Key Protection          | ✓   |          |
| BSIA Code of Practice Conformity | ✓   |          |
| Direct Line Connection           | ✓   |          |
| Keyholder Information            | ✓   |          |
| Upload Historic Log              | ✓   |          |
| Database                         | ✓   |          |
| Audit Trail                      | ✓   |          |
| Remote Diagnostics               | ✓   |          |
| Alarm Monitoring                 | ✓   |          |
| Multilayered Maps                |     | ✓        |
| Site Plans                       |     | ✓        |
| Floor Plans                      |     | ✓        |
| Detector Location                |     | ✓        |
| Import of Images (WMF/BMP)       |     | ✓        |
| Multiple Detector Types          |     | ✓        |

## GuardStation Remote

### INSTALLER AND USER BENEFITS

- PC-based management that provides a flexible integrated system designed to remotely configure, interrogate and monitor Guardall alarm control panels.
- Remote servicing is carried out with the PX range of products where all diagnostic readings can be uploaded and printed through the PC. This enables accurate panel specific information to be recorded reducing the need for the engineer to attend the site.
- Simple to use alarm activations, keyholders data and historic information at the touch of a key. Full customer histories are maintained on the system hard disk.
- Allows on site problems to be solved remotely by locating the problem and allowing a remedy to be carried out which can enable the system user to have their system up and running quickly and efficiently.
- Better utilisation of resources providing total in-house control of security installations from a centralised location and the capability to determine the level of response required.
- GuardStation Remote provides individual user profiles to be programmed with specific authorities that enable the user to perform tasks that are defined by the master user.
- A full audit trail is provided within GuardStation Remote. The audit trail stores user names, times and types of operation and the actions carried out are stored to a file which is automatically changed each month.
- Optional GSR Maps has detailed graphical representations – including detailed map references, security configurations, locations within buildings etc – based on Windows technology with built-in HELP facilities for every operation.
